# CYBER WORM:
Reflections on neural malware software

A worm is squirmin' in the korners ah me brain. Late at night when me body is still I feel it wriggle, chomp & giggle az it moves through me kranium. At first I hardly noticed dey blasted bugger, butt az memory after memory dissolved it became klear my entire mind is worm-infested: it's nothing butt ah medley ah chemicals & microbes which constantly mutate & re kombine

Nadya : I guess we all have worms in our brains.

Gus : Of course. There are so many ideological 'worms' in the environment, that we all get infected in some ways. The challenge is to keep coming back to our core values after fragmentation.

Liao : (sipping a cup of herbal tea, then wiping his lips) Isn't that what bravery is? Each person falls. However, it takes bravery to get up and recommit. Never fear getting cracked, bruised, or torn apart – we're only defeated when we cease trying to rebuild & restore.

Bill : (raising his eyebrows) Perhaps our general understanding of "worms" is incorrect? What if some worms actually contain useful information? Who decides what is a "worm" and what isn't?
